

Attachmate Security Check Offering

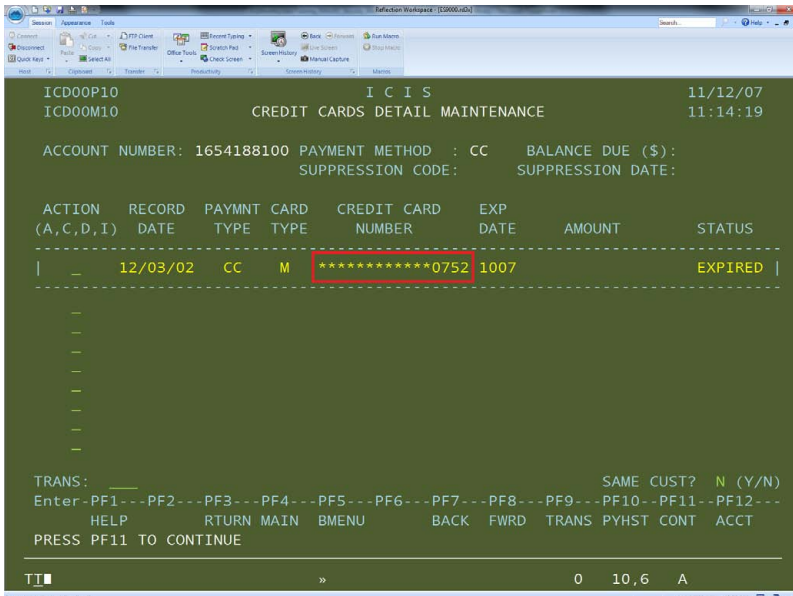

Is your host data protected?

Data on host systems is often the most sensitive on the network. Yet to access their mainframe hosts, many companies use older terminal emulators that don't comply with the latest security standards. These emulators leave host systems – and sensitive customer data – vulnerable to security breaches and insider fraud.

Do you know for certain that your emulator isn't too old? Do you know whether you're leveraging its security capabilities well enough to protect your host systems from security breach and insider fraud?

After the onsite analysis, we will produce a report of our findings on your host security implementation. Any recommendations will be introduced to you in detail during an onsite visit or through a webinar. After the Attachmate Security Check, you will be in a perfect position to minimize your host security risks.

To fully secure your host data, it's best to make use of a next-generation terminal emulation product that includes legacy host security. For example, Attachmate Reflection® terminal emulators provide secure access to traditional green-screen applications through a modern multi-layered architecture. But technology is just one part of a modern security architecture. Knowledge and execution are also key.

Reflection 2011 can mask data as it is being typed into host sessions.

If not, the Attachmate® Security Check can help you ensure that you're keeping pace with the latest security standards, requirements, and capabilities.

Reduce risks with the Attachmate Security Check

With the Attachmate Professional Services Security Check, you gain access to our deep knowledge of and longtime experience with host security. During a Security Check, an Attachmate specialist will examine how you've implemented and configured your terminal emulation software, as well as how you use it.

What does the Attachmate Security Check look at?

For many companies, host security means only encryption. While encryption is important, the Attachmate Security Check looks at a number of areas, including:

- **Encryption**

Is your SSL/TLS or SSH encryption technology current, and does it adhere to the highest security standards for encryption and cryptography?

- **Authentication**

Do you have centralized identity management in place that includes access control to host resources?

- **Access control**

Can you restrict access to a host resource through an existing LDAP authentication mechanism?

- **Privacy/user restrictions**

Can sensitive data on the screen, such as a credit card or national ID number, be masked or hidden? Are users restricted in using macros to collect important customer data?

- **Auditing and monitoring**

Do you know who accesses host resources and when?

Make use of the broad experience of the security experts from Attachmate Professional Services. We will help you implement a modern host security architecture so that you can better secure your host systems, and improve your compliance with new government regulations and standards such as PCI DSS.

Pricing details

The Attachmate Security Check is offered at attractive rates that are below our standard consulting rates. Please contact your Professional Services Engagement Manager or your Attachmate Sales Representative for current pricing.

About Attachmate Professional Services

For nearly 30 years, Attachmate has developed highly secure terminal emulation products, and helped customers seamlessly upgrade from less secure products. Through this deep experience, which includes dedication to a Secure Development Lifecycle, Attachmate allows you to address crucial security risks – and gain control of your terminal emulation desktops.

Improve Your Security with an Attachmate Security Check

Protecting Host Connections

During a Security Check, an Attachmate consultant will analyze whether your terminal emulator meets certain security criteria. This analysis will help you learn how to:

- Protect mission-critical data in motion on the network
- Leverage FIPS 140-2-validated cryptography with SSL/TLS and SSH
- Authenticate users using existing validation systems
- Hide sensitive data on host screens
- Protect credit card data to pass security audits
- Log access to sensitive host data
